Outline

1 Background

2 Motivation

- Why another visualization?

- Possible alternatives

- Summarizing requirements

- Goal

3 Our approach

- Fiber-tract selection

- Volumetric fiber-tract representation

- Effective connectivity animation

- Plugging it together

4 Results and further work

Outline

1 Background

2 Motivation

Why another visualization?

Possible alternatives

Summarizing requirements

Goal

3 Our approach

Fiber-tract selection

Volumetric fiber-tract representation

Effective connectivity animation

Plugging it together

4 Results and further work

Figure: Fiber-tracts
representing nerve-bundles

- Measured using DW-MRI
- Describes anatomical structure of the brain
- Fiber-tracts

Figure: fMRI scan as color-mapping on anatomical slices

- Measured using fMRI
- Reveals activations in brain on certain stimulus

Effective Connectivity I

- Anatomical Connectivity + Functional Connectivity = Effective Connectivity?

Effective Connectivity I

- Anatomical Connectivity + Functional Connectivity = Effective Connectivity?
 - No!
- It is a model
 - Explains causal relation of measured data
 - Input is graph of involved regions and stimuli

Effective Connectivity II

- Describes the information transfer between two regions A and B of the brain
- Regions are connected anatomically (fiber tracts)
- Two values exists per pair
 - For $A \rightarrow B$ and for $B \rightarrow A$
 - Big hurdle for simultaneous visualization

Figure: Graph showing the modelling

- From the visualization point of view it is a graph
 - Weighted and directed
 - Not necessarily planar
 - Nodes = regions
 - Edges = anatomical connection
 - Weights = effective connectivity

Possible alternatives

Summarizing requirements

Goal

3 Our approach

Fiber-tract selection

Volumetric fiber-tract representation

Effective connectivity animation

Plugging it together

4 Results and further work

Figure: Graph showing the modelling

- Can these graphs help to:
 - Understand the structure-function relationship?
 - Verify models with measured data?

The problem with 2D graphs II

- Growing model complexity means
 - No 2D layout possible matching anatomical structure in some projection
 - No anatomical structure of connection

Figure: Line Integral Convolution

Figure: GPU based advection

Figure: Particle animation

- Problem: only one direction, no weighting (besides color-coding).

Requirements

- Embedded visualization into the 3D domain
- Anatomical context, especially the fiber-tracts
- Selective browsing of large graphs in 3D
- Relative visualization of both effective connectivities on one connection
- Illustrative and appealing visualization
- Exploit the metaphor of moving information packages

Why another visualization?

Possible alternatives

Summarizing requirements

Goal

3 Our approach

Fiber-tract selection

Volumetric fiber-tract representation

Effective connectivity animation

Plugging it together

4 Results and further work

Figure: Selecting involved fiber-tracts using two masks for LGr and LGr.

Volumetric fiber-tract representation I

Figure: The bundle gets voxelized and filtered with a gauss kernel to smooth the jagged surface.

Figure: Parameterization of the volume along the so called center line or longest fiber-tract.

Figure: Two beams of different size representing information packages, a metaphor for effective connectivity strength.

Figure: Labeling of each connecting and embedding it into some anatomical context.

Video

Outline

1 Background

2 Motivation

Why another visualization?

Possible alternatives

Summarizing requirements

Goal

3 Our approach

Fiber-tract selection

Volumetric fiber-tract representation

Effective connectivity animation

Plugging it together

4 Results and further work

Results

- Embedded in its anatomical context
- Focus and context principles
- Both effective connectivity values on one connection
- Relative sizes for comparability of multiple connections
- Illustrative and metaphoric character

Problems and Further Work

- Animation?
 - Evaluation of other animations and color-codings
- Scaling problems and relative sizes
 - Evaluation of scaling schemes
- Visual clutter
 - Addition of easier browsing tools
 - Evaluation of large connectivity graphs
